

Add on Feature - Truck Management

- A module that assists with the management and recording of delivery weights and volumes for each truck used on a delivery run or range of delivery runs
- A Truck Master table allows for Trucks to be setup and the maximum allowable loaded weight and volume of each truck recorded
- Once trucks have been setup the warehouse manager can then allocate deliveries to individual trucks for a selected delivery date and delivery run or range of runs
- This process will highlight in red if the capacity of a truck being used for the run has been exceeded and if necessary allow deliveries to be taken off the select truck and another higher capacity truck used or the delivery split into two or more trucks
- A driver's manifest can be automatically produced for the selected truck which allows a manifest to be produced truck by truck rather than a manifest for the complete run
- Delivery weight and volume details by delivery date, delivery run and truck are stored in the sales history tables. A report has been developed to allow these details to be printed if necessary. This can be important information if needing to document truck weight and volume for an insurance claim
